INTERPOS

The open source type interpolation routines INTERPOS are developed at the Swiss Plasma Center, Ecole Polytechnique Fédérale de Lausanne (SPC/EPFL), Switzerland.

INTERPOS is a versatile set of interpolation routines including cubic splines with tension, for which different boundary conditions and error bars can be specified.

The TCI users have received a copy of INTERPOS under the conditions that:

- 1.- The code does not change its name even if modified.
- 2.- Modifications of the code that are developed are made available to the SPC.
- 3.- Results produced with the original or the modified versions of INTERPOS should appropriately reference the original publications:

O. Sauter, SPC-EPFL, private communication (*a publication is under development*)
- 4.- INTERPOS can be used by the TCI users under the above conditions. TCI users can obtain the sources to be installed at their home institutes after signing the code transfer document (<https://spc.epfl.ch/interpos>).
